

# James Webb Space Telescope: Solar System Science and Mission Progress

**John Mather**  
**JWST Senior Project Scientist**  
**NASA's Goddard Space Flight Center**

**on behalf of 7 billion current Earthlings, ~10,000 future observers, ~ 1000  
engineers and technicians, ~ 100 scientists worldwide, 3 space agencies**

# James Webb Space Telescope

## Organization

- **Mission Lead:** Goddard Space Flight Center
- **Senior Project Scientist:** John Mather
- **International collaboration:** ESA & CSA
- **Prime Contractor:** Northrop Grumman Aerospace Systems
- **Instruments:**
  - Near Infrared Camera (NIRCam) – Univ. of Arizona
  - Near Infrared Spectrograph (NIRSpec) – ESA
  - Mid-Infrared Instrument (MIRI) – JPL/ESA
  - Fine Guidance Sensor (FGS) & Near IR Imaging Slitless Spectrometer – CSA
- **Operations:** Space Telescope Science Institute

## Description

- Deployable infrared telescope with 6.5 meter diameter segmented adjustable primary mirror
- Cryogenic temperature telescope and instruments for infrared performance
- Launch on an ESA-supplied Ariane 5 rocket to Sun-Earth L2
- 5-year science mission requirement (10-year propellant lifetime)

# Planetary Scientists helping to define and build JWST

- Heidi Hammel, IDS (interdisciplinary scientist), AURA VP
- Jonathan Lunine, IDS, Cornell
- Stefanie Milam, GSFC project science team
- Mike Meyer, ETH Zurich, NIRCам team, was member of first SWG (along with Phil Nicholson of Cornell) advocating solar system science, wrote Design Reference Mission items

# What's Special about JWST solar system capabilities?

- HST (or better) angular resolution at longer wavelengths: diffraction limited 6.5 telescope at 2  $\mu\text{m}$  (resolve planets, satellites, comets...); smallest pixels 0.032 arcsec
- Zodi background limited imaging sensitivity for  $\lambda < 12 \mu\text{m}$  (faint objects like KBO's, asteroids, satellites of Pluto, planetary rings)
- Full coverage from 0.6 to 28  $\mu\text{m}$  with imaging *and* spectroscopy,  $R = \lambda/\delta\lambda = 3000$  (chemistry and physics)
- Follows ephemeris up to at least 0.03 arcsec/sec for moving targets, enough for all accessible solar system targets
- Can observe all planets and satellites except Mercury, Venus, Earth, and Moon (from 85 to 135 deg from Sun)
- Subarray readout modes for bright objects

# The James Webb Space Telescope

James E. Webb (1906 – 1992)

- Second Administrator of NASA (1961 – 1968)
- Oversaw first & Second manned spaceflight programs (Mercury, Gemini)
  - Oversaw Mariner and Pioneer planetary exploration programs
- Oversaw Apollo program: On time, On budget! (he asked for enough!)
  - Supported space science at NASA and universities

# The James Webb Space Telescope

## JWST Launch

- Launch vehicle is an Ariane 5 rocket, supplied by ESA
- Site will be the Arianespace's ELA-3 launch complex near Kourou, French Guiana

# The James Webb Space Telescope

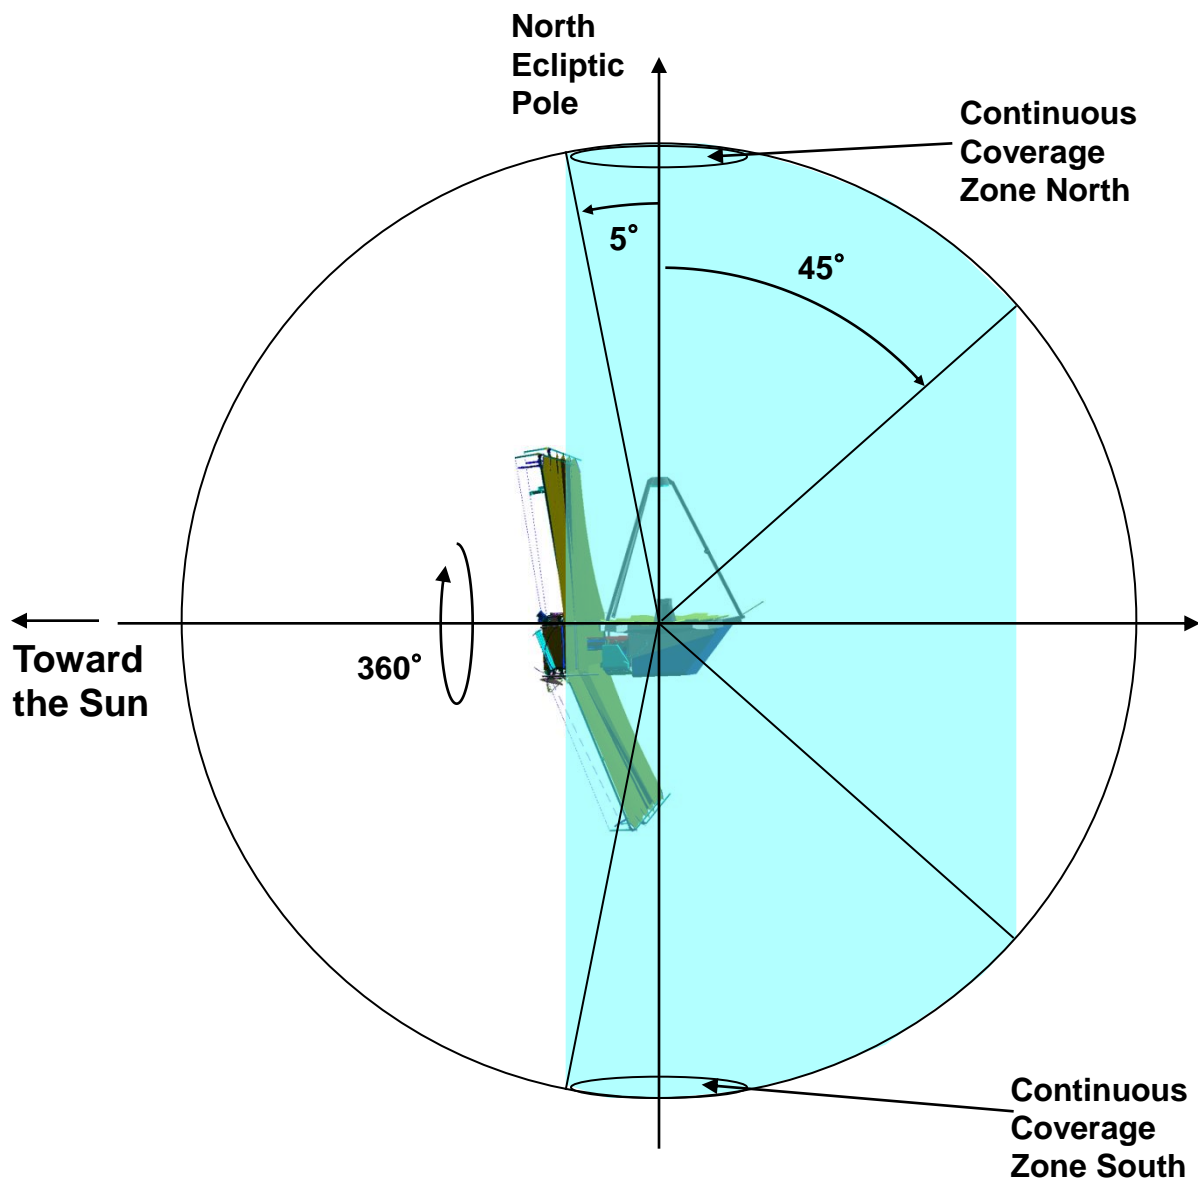

## JWST Orbit

- JWST will orbit Sun-Earth L2 Lagrange point, 1.5 million km from Earth

- The required celestial coverage for the observatory is 35% of the celestial sphere
- The sunshield is currently sized to provide at least 39% coverage
- Field of Regard is an annulus with rotational symmetry about the L2-Sun axis, 50° wide
- The observatory will have full sky coverage over a sidereal year
- There are continuous viewing zones 5° about the North and South Ecliptic Poles
- The observatory will have a roll capability about the telescope boresight of  $\pm 5^\circ$

# JWST and its Precursors

## HUBBLE

2.4-meter  
 $T \sim 270 \text{ K}$

$123'' \times 136''$   
 $\lambda/D_{1.6\mu\text{m}} \sim 0.14''$

## JWST

6.5-meter  
 $T \sim 40 \text{ K}$

$132'' \times 264''$   
 $\lambda/D_{2\mu\text{m}} \sim 0.06''$

$114'' \times 84''$   
 $\lambda/D_{20\mu\text{m}} \sim 0.64''$

## SPITZER

0.8-meter  
 $T \sim 5.5 \text{ K}$

$312'' \times 312''$   
 $\lambda/D_{5.6\mu\text{m}} \sim 2.22''$

$324'' \times 324''$   
 $\lambda/D_{24\mu\text{m}} \sim 6.2''$

## Wavelength Coverage

# JWST Design: Key Features

	MIRI	23	0.11	30 x 30"

# JWST Spectroscopy Modes

Mode	Instrument	Wavelength (microns)	Resolution ( $\lambda/\Delta\lambda$ )	Field of View
Slitless Spectroscopy	NIRISS	1.0 – 2.5	150	2.2 x 2.2'
	NIRISS	0.6 – 2.5	700	single object
	NIRCam	2.4 – 5.0	2000	2.2 x 2.2'
Multi-Object Spectroscopy	NIRSpec	0.6 – 5.0	100, 1000, 2700	3.4 x 3.4' with 250k 0.2 x 0.5" microshutters
Single Slit Spectroscopy	NIRSpec	0.6 – 5.0	100, 1000, 2700	slits with 0.4 x 3.8" 0.2 x 3.3" 1.6 x 1.6"
	MIRI	5.0 – ~14.0	~100 at 7.5 microns	0.6 x 5.5" slit
IFU Spectroscopy	NIRSpec	0.6 – 5.0	100, 1000, 2700	3.0 x 3.0"
	MIRI	5.0 – 7.7	3500	3.0 x 3.9"
	MIRI	7.7 – 11.9	2800	3.5 x 4.4"
	MIRI	11.9 – 18.3	2700	5.2 x 6.2"
	MIRI	18.3 – 28.8	2200	6.7 x 7.7"

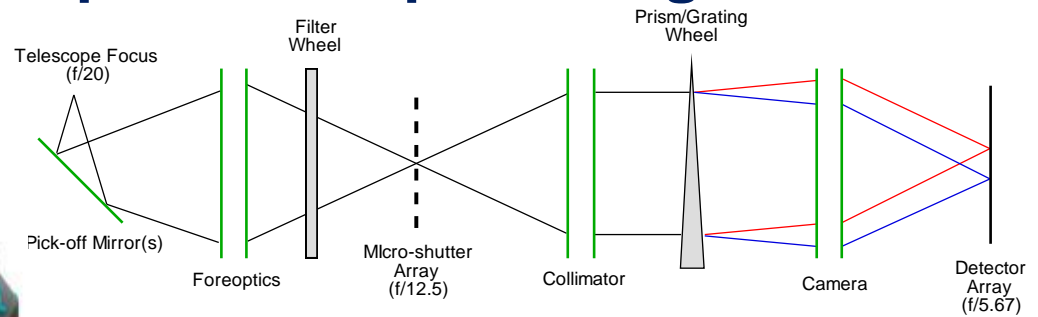

# NIRCam will provide the deepest near-infrared images ever and will identify primeval galaxy targets for the NIRSpec

- Developed by the University of Arizona with Lockheed Martin ATC
  - Operating wavelength: 0.6 – 5.0 microns
  - Spectral resolution: 4, 10, 100 (filters + grism), coronagraph
  - Field of view: 2.2 x 4.4 arc minutes
  - Angular resolution (1 pixel): 32 mas < 2.3 microns, 65 mas > 2.4 microns, coronagraph
  - Detector type: HgCdTe, 2048 x 2048 pixel format, 10 detectors, 40 K passive cooling
  - Refractive optics, Beryllium structure
- Supports OTE wavefront sensing

# The NIRSpec will acquire spectra of up to 100 galaxies in a single exposure

- Developed by the European Space Technology Center (ESTEC) with Astrium GmbH and Goddard Space Flight Ctr
  - Operating wavelength: 0.6 – 5.0 microns
  - Spectral resolution: 100, 1000, 3000
  - Field of view: 3.4 x 3.4 arc minutes
    - Aperture control:
      - **Programmable micro-shutters**, 250,000 pixels
      - **Fixed long slits & transit spectroscopy aperture**
      - **Image slicer (IFU)** 3x3 arc sec
  - Detector type: HgCdTe, 2048 x 2048 format, 2 detectors, 37 K passive cooling
  - Reflective optics, SiC structure and optics

# The many faces of Titan

*Saturn's moon Titan, second largest moon in the solar system, has a nitrogen-methane atmosphere four times denser at its surface than the air at sea level on Earth. In the cold environment methane forms clouds and rain, functioning in much the same way that water does in the Earth's atmosphere. The methane carves out river valleys and fills lakes and seas, discovered by Cassini.*

- Because of the dense atmosphere, different wavelengths probe different altitudes, as shown in the series of images from the ESO's VLT. But JWST will cover a much longer, continuous wavelength range than Earth observatories, allowing a more complete top-to-bottom monitoring of Titan's atmosphere.

# Keeping tabs on large-scale changes on Titan after Cassini is gone

*Cassini and ground-based telescopes have observed large scale changes in Titan's atmosphere and surface. In 2010, following an outburst of clouds, an area of the surface 2000 km in length darkened and then brightened again over four months. Cassini's mission ends in 2017 and JWST will be launched the following year.*

- The map below is constructed from images by ESO's VLT, with a resolution of 360 km, just slightly better than JWST's resolution at 2 microns. The superposed line is 2000 km in length, and changes over such scales will be easily seen by JWST.

# Tracking teleconnections equator to pole

*Titan has seasons, just as the Earth does—and with about the same amplitude of tilt. But each Titan season is 7 years long. When JWST is launched it will be early northern summer, and the Cassini Solstice mission will have just ended. This is the time when the north polar region—home to Titan’s methane-ethane seas—will be receiving maximum sunlight and reaching their highest temperatures. Cassini has never observed this seasonal phase of Titan.*

- JWST can observe over many wavelengths, and hence a wide altitude range, for atmospheric changes including cloud systems that might be triggered by the abundant sunlight in northern summer—the period from 2017-2025.

- JWST can map out possible seasonally-driven “climate teleconnections” between the polar and equatorial atmospheres. Such teleconnections have been observed from Earth: Images on the right from Gemini observatory show a large cloud outburst in the equatorial region of Titan, which may have triggered the south polar cloud (arrow) seen some two weeks later.

- Simultaneous measurements with a polar probe (*TiME*) will be of very high value.
